

ABSTRACT

5 An adjustment device for a Bowden cable arrangement is described in the form
of a manual lock or tensioning lock, which comprises a housing (10), a threaded
spindle (70) guided in the housing (10) in a torsionally-resistant and axially
movable manner, which is to be connected by a wire to the Bowden cable
arrangement, and two half-shell elements (50), which are arranged in the housing
10 (10) in an axially-secure and rotatable manner, and are in threaded engagement
with the threaded spindle (70). Located at the housing (10) is a shoulder element
(16) with an opening (13) through which the wire of the Bowden cable
arrangement is guided in the axial direction out of the adjustment device.
Allocated to the shoulder element (16) is a sleeve (30), which is to be placed in
15 positive fit on the shoulder element (16) and prevents any deformation of the
shoulder element (16) when the adjustment device is actuated.
